

dime.scheduler

Dime.Scheduler is the graphical resource planning tool of choice for Microsoft Dynamics partners and users that are looking to integrate planning functionality into their business processes and vertical solutions.

Dime.Scheduler, what else?

One planner to rule them all

1

Do you need to plan technicians, consultants, horses, repairs, hotel rooms, boats, maintenance, beamers, wind mills, projects, trucks, sales people, shop floor production, meeting rooms, workers, deliveries, cars, airplanes, to-do's, rental equipment, events, reservations, construction machinery, patients, development, water bikes, sales quotes or more?

With Dime.Scheduler everything can be a resource and anything can be a task.

Have you ever thought about scheduling resources from Dynamics NAV and Dynamics CRM in one planning solution? Have you ever thought about scheduling tasks from different functional areas in one planning solution? Dime.Scheduler brings together your planning data from multiple locations, companies, business units, databases and instances.

With Dime.Scheduler one resource has one planning.

Control is yours

Continuous interaction showing real-time status of tasks.

With Dime.Scheduler you implement planning functionality into business processes, standard or custom. You add graphical resource planning to your vertical solution without leaving Microsoft Dynamics.

You adapt Dime.Scheduler to your customer with colours, indicators, customisable captions in any language and a personal layout of the user interface.

With Dime.Scheduler it doesn't stop after planning a task as a continuous interaction with the business processes updates the plan board in real time showing the status and progress of the process or source document.

These updates are shown immediately, instantly, on every screen, without a Refresh button. Just think of dashboard monitors, control room monitors, floor and shop monitors ... it is yours.

One day is not the same as the next day. The same goes for working times.

With Dime.Scheduler you can feel comfortable that you respect the working days and hours of each individual, even machines get tired once in a while.

You adapt Dime.Scheduler to your customer with flexible and powerful but easy capacity and working hours setup.

With **Time Slot templates** you control a day of work up to the minute for all your resources, groups of resources or individuals. You control the behaviour of each time slot: available, locked, confirmed override or auto-extend.

With Time Slot templates you control multiple working calendars, working shifts and allowed overtime. You control the essence of working time.

Time is of
the essence

Time Slots to manage shifts and varying working hours.

Segregation

Service, Jobs and HR planning,
using the second plan board for Equipment.

In Dime.Scheduler everything can be a resource filter. The Auto-Filter assists in selecting those resources that comply with the conditions set for a task.

The resource filters work together with user security; we like to show you some examples of how that powerful combination easily achieves segregation of **duties** and **responsibilities**.

Departmental segregation

You set up a resource filter for departments (Service, Production, HR) and assign resources **and** users to a department. Users only see the resources **and** tasks of the same department. When HR approves a holiday request, registers a training or staff meeting these are immediately created as planned tasks which are visible but not editable to users of Service and Production.

Geographical segregation

You set up a resource filter for zones or regions. You assign resources **and** users to one or more zones. Users only see the resources **and** tasks that are assigned to the same zones. Tasks planned in other zones are visible but not editable.

With the built-in map Dime.Scheduler shows your tasks, planning, resources and assets in one place. You can visualise addresses for open tasks and planned tasks to select the best resource.

With hardware- and device-independent Resource GPS Tracking you always know who to call when that urgent request comes in. Send GPS coordinates directly from the device or from a mobile solution connected to Microsoft Dynamics that supports GPS tracking.

Do you have a rental business, expensive equipment, multiple locations or other valuable assets? With Asset Tracking you show them on the map.

When filtering resources Dime.Scheduler still shows all resources on the map so you can see that the best resource might not be the resource closest to the customer.

You can overlay live Traffic Information onto the map at any time.

Track everything

Features

- > From kick-off to go-live in just a few days even in a custom or vertical solution.
- > Immediate insight into availability with Availability Sorting.
- > Automatically filter resources based on task attributes.
- > Visualise your planning, track resources & assets and monitor traffic information.
- > Let your users work in one central plan board, in multi-language, connected to multiple functional areas and applications, with personal screen layouts, showing only the data they need, segregated and secured.
- > Open linked documents, web pages and Dynamics NAV or CRM pages from within Dime.Scheduler.
- > Define special time slots to allow, restrict or auto-extend appointments.
- > Plan equipment, replacements, vehicles, infrastructure,... in a second plan board.
- > Plan and navigate in an easy way thanks to a familiar user interface, drag & drop, powerful filtering, grouping & sorting and multiple views.
- > Add planning to your business processes.
